

Health & Disability

Kentucky National Core Indicators

Kentucky rates of obesity and high blood pressure are well above the national average. For Kentuckians with a disability, and especially for those with cognitive or mobility limitations the numbers are even more startling. Much of this can be attributed to behavioral factors such as physical inactivity and poor nutrition.

Kentuckians with disabilities:

Preventative Screenings for Kentuckians with Intellectual and Developmental Disabilities*

Kentuckians with Intellectual and Developmental Disabilities*

*National Core Indicators, 2018

Kentucky ranks 43rd nationally in rates of death due to heart disease, 46th in adult population with hypertension, and 45th in physical inactivity, with especially high rates of heart disease in eastern Kentucky. Compared with urban areas, rural communities have higher rates of preventable conditions such as obesity and cancer, and higher rates of high-risk health behaviors such as smoking, physical inactivity, and poor diet. As a rural state with a high poverty rate, Kentucky has critical needs for improving heart health and improving access to health promotion, and especially for individuals with disabilities.

Resources

Kentucky National
Core Indicators

A variety of resources that can help improve your health are found all around Kentucky.

The health and wellness initiative at the Human Development Institute raises awareness of health disparities, while helping people with disabilities and their support networks take charge of their health. We provide resources via lessons, videos, activities, and tips on running effective health promotion programming for people with varying abilities, as well as updates on current statewide health initiatives and ways to get involved.
